

Dynamic-LR Baseline Pipeline *Deterministic · No LLM · Loop-Controlled*

Loop-Control Summary **Outer loop:** for query in sorted_queries (sorted shortest-first) — saturation window = 3, threshold = 5%, exits early if too few new papers. **Inner loop:** for source in [arXiv, S2, OA] — source skipped after 3 consecutive failures; success resets counter. **Dedup:** runs inside inner loop; returns `new` used for yield rate. **-dry-run:** loops execute normally, file writes are simulated.
